

Amendments to the Abstract

Please **add** the following Abstract to this application.

--A gateway apparatus is capable of distributing audio, video, and/or data signals in a household and/or business dwelling using the existing coaxial cable infrastructure. According to an exemplary embodiment, the gateway apparatus includes signal processing elements which receive signals from a satellite source and process the received signals to generate analog signals corresponding to a desired satellite transponder. A controller enables generation of the analog signals responsive to a request signal. The analog signals are provided to a client device via a coaxial cable connecting the gateway apparatus and the client device.--
